1. Introduction

This document is the Tier 1 Data Manual for the Head and Neck 5000 study (H&N5000), version 3.0.

The Head and Neck 5000 study is a prospective clinical cohort involving approximately 5,000 people with head and neck cancer. The primary aim was to evaluate the outcome of centralisation in head and neck cancer services, but preliminary analysis suggests little variation in outcomes between centres.

This manual covers various aspects, including recruitment criteria, data collection methods, questionnaire sections, available variables, and application procedures for accessing the data.

Data were collected from clinical notes and participants at four timepoints: baseline, 4 months, 12 months, and 36+ months. The questionnaire sections cover various topics such as demographics, health behaviours, general health, specific health aspects, feelings, diet, thoughts around cancer recurrence, personal costs, quality of life, difficulties in life, appearance, late toxicity, and sexual history.

The available variables include demographic information, baseline health behaviours, data from the Baseline Data Capture Form, mortality data, and questionnaire variables covering different sections. Each variable has a specific name and definition.

This manual also outlines the application process for researchers to access the data, which involves submitting a Head and Neck 5000 Resource Research Proposal Form, variable request, and undergoing approval from the Head and Neck 5000 Executive Group.

This document serves as a comprehensive guide for researchers intending to use data from the Head and Neck 5000 study for various research purposes related to head and neck cancer.

All information contained in this data manual is for descriptive purposes only and should not be reported in research papers. All data included in research papers should be generated directly from the Head and Neck 5000 datasets.

1.1 Background

Full details of the H&N5000 study can be found at www.headandneck5000.org.uk. In brief, the H&N5000 study is a prospective clinical cohort of approximately 5,000 people with head and neck cancer. It brings together clinical data, patient-reported outcomes, and biological samples in a single coordinated resource for aetiological, translational and prognostic research. The first recruitment site opened on 5th April 2011, with the first participant being consented to the study on the 7th April 2011. Recruitment was completed on 31st December 2014.

1.2 Study Aims and Objectives

The justification for setting up this study was to evaluate the outcome of centralisation in head and neck cancer services. The initial aim of the H&N5000 study was to recruit a clinical cohort of 5,000 people with head and neck cancer and then follow up this cohort for two years. Specifically, the objectives were to:

- Compare morbidity and mortality outcomes across different centres.
- Compare quality of life outcomes across different centres.
- Describe the individual economic cost of head and neck cancer care.
- Identify prognostic indicators for head and neck cancer.
- Create a resource for translational and applied research in head and neck cancer.

We have described the centralised multi-disciplinary service in the UK. However, preliminary analysis suggests there is little variation in outcome between centres, so we are unlikely to be able to evaluate the impact of centralisation on outcome. We have established an important bio-medical resource that is being widely used and that making important contributions to aetiologic and prognostic research.

2. Recruitment

Participants were recruited from 76 study sites across England, Scotland, and Wales. Every person with a presumed new diagnosis of head and neck cancer seen or discussed at the Multidisciplinary Team (MDT) meeting or clinic was eligible for inclusion into the study. This included those enrolled in other observational studies or trials.

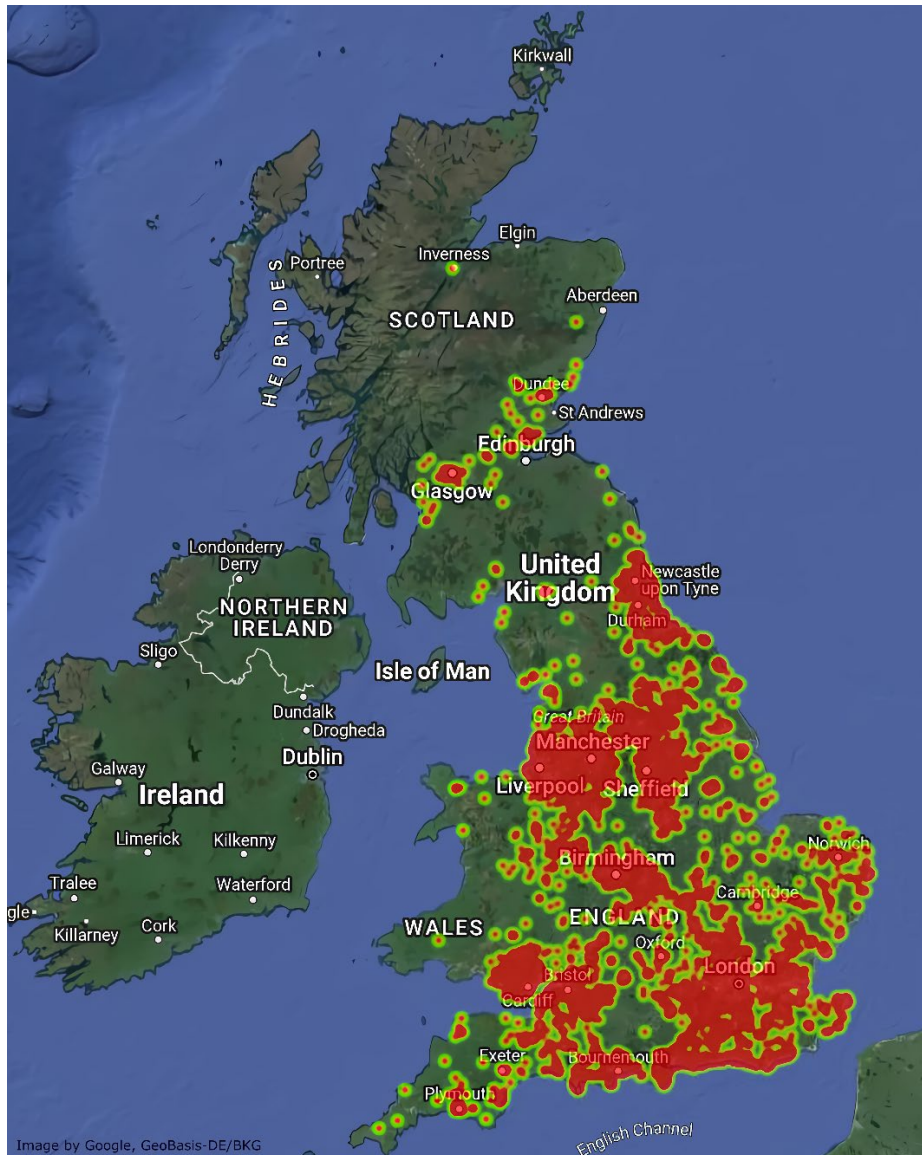

Patients with an unknown primary, and those without a histological diagnosis, were eligible if the MDT decision was that the primary is likely to be a head and neck cancer and the patient is aware of the clinical decision.

The following exclusion criteria were applied : -

- People who were considered to meet the criteria for mental incapacity or vulnerability set out in the mental capacity/vulnerable adult act.
- People who did not have cancer of the head and neck.
- People who had a recurrence of their cancer of the head and neck rather than a new diagnosis.
- People with lymphoma.
- People with skin cancer.
- People with a secondary head and neck tumour.
- People aged under 16.
- Patients who have already commenced their cancer treatment (with the exception of those whose treatment is also their diagnostic procedure)
- Carcinoma in Situ where there is no evidence of invasion (these patients were only eligible if a clinical diagnosis of cancer had been made by the MDT)

2.1 Recruitment Heat Map

This map shows the distribution of participants recruited across the UK, by their postcode locations.

3. Application Process

- Applicants are to familiarise themselves with the latest documentation from the H&N5000 website at www.headandneck5000.org.uk.
- Applicant completes the HN5000 Project application webform <https://forms.office.com/e/ORSS2n4BLT>
- The application will be considered by the HN5000 Executive Group within 28 days. If approved, a member of the Executive Group will be assigned to your project.
- If approved you will receive a confirmation email from the HN5000 Executive Group, this email will also include a link to the variable request form, publication checklist and sample DMTA.
- Using this document for reference, complete the Variable Request form.
- Once submitted your request will be processed and data released when contracts, ethics and funding documentation is complete.
- You will be sent a password protected encrypted zip file data pack, containing a copy of your variable request, a csv and a txt file containing your data. Your data will have been assigned project specific Study ID Numbers, so will not be linkable with any other projects.
- Please note, we are unable to provide any explicit dates in our datasets, you will instead be provided with a count of days from consent to the date requested.

4. Data Collection

4.2 Questionnaire Sections

In this section we describe the questions used in the Head and Neck 5000 (H&N5000) study. Questionnaires were given out at baseline (consent) and sent out at 4 and 12 months after consent during the original study. A further questionnaire was sent out 3 – 5 years after consent in the Follow up study. We divided the content of the questionnaires into sections that are made up of one or more groups and have summarised these in the table below. For each group of questions, we have included what the questions measure, validation of the questions and when used in Head and Neck 5000.

Section	Title	Research Topic	Ref
A	About You	Demographics: Date of birth, height, weight, gender, postcode, ethnicity, marital status, and education (A3-A7)	These are new questions designed for this study.

		Smoking and alcohol use (A8-12 and A13-16)	These questions were originally developed for use in the CLEAR study (Sitas et al., 2015) and The Million Women study (The Million Women Study, 1999). The CLEAR study recruited residents of New South Wales, Australia ≥18 years old, with a first incident cancer. The Million Women Study is a national UK study of women's health, involving more than one million UK women aged 50 and over.
		Marijuana use (A12A-A12C)	These questions have not been formally validated. The questions were developed for use in this questionnaire. The marijuana terms used in these questions were selected based on a previously published questionnaire on substance abuse, which was used as part of the European School Survey Project on Alcohol and Other Drugs (ESPAD, 2016).
		Working and income (A17-A23)	These questions were adapted from West of Scotland Twenty-07 cohort Study (Benzeval et al., 2009) and the Alcohol-Related Cancers And Genetic-Susceptibility (ARCAGE) European multicentre head and neck case control study (Lagiou et al., 2009).
		Health Status - WHO / Eastern Cooperative Oncology Group (ECOG) performance status (A24)	The WHO/ECOG performance status has been shown to be reliable in studies which have tested its inter-observer variability. Both patient and oncologist assessed scores have been shown to reflect survival duration as well as disease stage with oncologist assessed scores being only marginally more predictive of survival (Blagden et al., 2003).
		Health Status EQ-5D- 5L (A25-A26)	EQ-5D health states can be converted into to a single summary index by applying a formula which attaches weights to each of the levels in each dimension. Instructions on how to code the EQ-5D-5L can be found on the EuroQol website: (EuroQol, 2019).
B	Your Outlook	Life orientation test revised (B1-10)	The LOT-R has been used extensively in research and has proven useful in predicting psychological well-being, physical health and recovery after severe illness or surgery (Glaesmer et al., 2012; Scheier et al., 1994).
C	Your General Health	Quality of Life – The European Organisation for the Research and Treatment of Cancer (EORTC) QLQ-30 (C1-C30)	The EORTC-QLQ-C30 was first validated in a cross-cultural sample of lung cancer patients, conducted across 13 countries (Aaronson <i>et al.</i> , 1993). It has since been used in a wide range of cancer clinical trials, by a large number of research groups.
D	Specific Aspects of Your Health	EORTC Head and neck specific quality of life QLQ - H&N35 (D1-D35)	The EORTC QLQ-H&N35, in conjunction with the QLQ-C30, was tested and validated in a large and diverse sample (n = 622) of people from twelve different countries including the UK who had either been newly diagnosed with HNC, had recurrent HNC or who had been disease-free for 1-3 years after treatment (Bjordal et al., 1993). The instrument was found to be well accepted, had a high level of construct validity, and was responsive to differences between disease status, site, and patients with different performance status.

		<p>Patient reported outcome Charlson Co-Morbidity Index (PRO-CCI)</p> <p>(D36-54)</p> <p>These questions were only used in the 3 – 5 year follow up questionnaire.</p>	<p>The original PRO-CCI was administered to 882 people with head and neck cancer (Habbous et al., 2013). Whilst this patient-reported version correlated well with the standard (medical record-abstracted) CCI for comorbidities including diabetes and prior cancer, connective tissue disease (CTD) and chronic obstructive pulmonary disease (COPD) showed marked disagreement. Discrepancies were thought to be a result of people reporting various non-rheumatological diseases or symptoms of CTD (e.g. osteoarthritis or aches and pains in the bones and joints). As a result, a modified PRO-CCI questionnaire was developed which aimed to provide more accurate reporting for CTD. This modified version was validated in an additional cohort of people with head and neck cancer, lung, or oesophageal cancer (n=102). The modified PRO-CCI demonstrated high compliance, a good level of agreement with the standard CCI and was a good predictor of survival cancer (Habbous et al., 2013).</p>
		<p>History of cervical cancer</p> <p>(D55-D56)</p> <p>These questions were only used in the 3 – 5 year follow up questionnaire.</p>	<p>These questions were developed for this study and have not been used elsewhere.</p>
		<p>History of tonsillectomy</p> <p>(D57-D58)</p> <p>These questions were only used in the 3 – 5 year follow up questionnaire.</p>	<p>These questions were developed for this study and have not been used elsewhere.</p>
E	Your Feelings	<p>Hospital Anxiety and Depression Scale</p> <p>(E1-E14)</p>	<p>Whilst HADS was developed as a screening instrument for use in hospital outpatient departments, it has subsequently been validated for use within primary care settings and within the general population (McDowell, 2006; Snaith, 2003). Its use has been supported in two major reviews (Herrmann, 1997; Bjelland et al., 2002). Studies have used the HADS to examine psychological distress in people with head and neck cancer, worldwide and in the UK specifically. For a comprehensive overview of these, please see Joseph et al., 2013.</p>
F	Your Diet	<p>Fruit, vegetable, and fried food consumption</p> <p>(F1-F3)</p>	<p>These questions have been modified from the semi-quantitative food frequency questionnaire (FFQ). The FFQ questionnaire was validated in a large prospective study of 173 female registered nurses aged 34-59 years, residing in the Boston area from 1980 to 1981 (Willett et al., 1985). The authors concluded that the self-administered dietary questionnaire could provide useful information about individual nutrient intakes over a one-year period.</p>

		<p>Eating habits</p> <p>(F4-F10)</p> <p>These questions were only used in the 3 – 5 year follow up questionnaire.</p>	<p>These questions were developed for this study and have not been used elsewhere.</p>
		<p>Antacid use</p> <p>(F11-F14)</p> <p>These questions were only used in the 3 – 5 year follow up questionnaire.</p>	<p>These questions were developed for this study and have not been used elsewhere.</p>
		<p>Feeding tubes</p> <p>(F15-F20)</p> <p>These questions were only used in the 3 – 5 year follow up questionnaire.</p>	<p>These questions were developed for this study and have not been used elsewhere.</p>
G	You and Cancer	<p>Fear of recurrence</p> <p>(G1-G4)</p>	<p>The four items used are part of the seven-item scale used in (Rogers et al., 2016)</p>
H	Your Personal Costs	<p>Cost of cancer over the last year</p> <p>(H1-H12)</p>	<p>These questions were developed for this study by Dr. Melissa Ke and have not been used elsewhere.</p>
I	Your Quality of Life	<p>The revised University of Washington QoL questionnaire</p> <p>(I1–I17)</p> <p>Data only collected at three sites</p>	<p>The questionnaire is widely used and has been validated in studies by Hassan and Weymuller (1993) and the revised version of the questionnaire by Rogers et al (2002).</p>
J	Difficulties in Your Life	<p>The Social Difficulties Inventory</p> <p>(J1 – J21)</p> <p>Data only collected at three sites</p>	<p>The Social Difficulties Inventory is a validated questionnaire developed for assessing social difficulties in cancer patients (Wright P et al. 2005)</p>
K	Your Appearance	<p>The Derriford Appearance Scale</p> <p>(K selected numbers)</p> <p>Data only collected at three sites</p>	<p>The DAS24 is widely applicable, psychometrically robust and discriminates well between patient groups, between clinical and non-clinical populations (Carr and Moss 2005).</p>
L	Late Toxicity	<p>Late Radiotoxicity questionnaire</p> <p>(L1-L27)</p>	<p>These questions have been developed as part of the RAPPER study (Radiogenomics: Assessment of Polymorphisms for Predicting the Effects of Radiotherapy). The main objective of the RAPPER study is to understand why some patients who receive radiotherapy are more likely to experience side effects than others. The study aimed to recruit >6000 people with different cancer types, including breast; prostate; gynaecological; lung; and head and neck cancers. Questionnaires were designed specifically for each cancer group. We have used the questions outlined in the RAPPER head and neck questionnaire.</p>

M	Sexual History	Sexual history questionnaire (M1-M9)	The questions are from a questionnaire designed by Sonia Duffy at the University of Michigan.
T	Your Dental Health	Teeth and dental care (T1-T4) These questions were only used in the 3 – 5 year follow up questionnaire.	Question T1 is a revised version of the Scottish Health Survey (SHS) dental module question 1 (ScotCen Social Research et al., 2016). People are able to provide reasonably reliable self-reported data concerning the number of natural teeth present (Axelsson and Helgadottir, 1995; Heløe LA 1972). Questions T2, T3 and T4 are also amended SHS dental questions.

5.4 Derived Variable Descriptions

5.4.1 Derived from Questionnaire

Variable Name	Questionnaire Sub-section	Related Variable	Definition	Calculation
dv_ay_height_cm	Section A	ay_a3_Height	Height in centimetres. Heights were given in feet or metres; derived variable standardises the measurements into meters.	$hn1_dv_height_cm = (hn1_a3b_ay_feet_height * 0.3048) + (hn1_a3c_ay_inches_height * 0.0254)$ Or $hn1_dv_height_cm = hn1_a3a_ay_cms_height / 100$
	Core variables	Height		
dv_ay_weight_kg	Section A	ay_a4_Weight	Weight in kilograms : - Weights were given in stone or Kgs; derived variable standardises the measurements into Kgs.	$hn1_dv_weight_kg = (hn1_a4_b1_ay_stone_weight * 6.3502932) + (hn1_a4_b2_ay_lbs_weight * 0.45359237)$ Or $hn1_dv_weight_kg = hn1_a4_a_ay_kg_weight$
	Core variables	Weight at baseline		
dv_ay_weight_6mnths_ago_kg	Section A	ay_a4a_Weight6MnthsAgo	Weight 6 months ago in kilograms	<i>(Same calculation as dv_ay_weight_kg)</i>
dv_ay_pack_years	Section A	N/A	Smoking pack years : - *12 was used as the minimum age for these calculations. If participants reported starting	$Packs = (cigarettes + hand\ rolled\ cigarettes) / 20$ $(hn1_ay_a11a_TobacUsageCigsDay + hn1_ay_a11b_TobacUsageRollDay) / 20$

			<p>smoking before 12, their smoking before 12 was not included in the calculations for this pack-years variable.</p> <p>Pack-years = 0 for never smokers.</p> <ul style="list-style-type: none"> • Participants are defined here as never, former or current smokers based on their response to <i>hn1_ay_a8_Tobac</i>. • Questions on other forms of tobacco (<i>hn1_ay_a11c_TobacUsagePipeDay</i>, <i>hn1_ay_a11d_TobacUsageSmklsDay</i>) were ignored when calculating pack-years. • Participants were coded as missing if they were current or former smokers and reported smoking zero cigarettes. (2 participants) • If participants gave data that resulted in a duration of zero or a negative value close to zero (minimum -3), duration was recoded to 1 year. For example, someone who is 45 years old might report starting smoking at 20 and quitting 25 years ago. (12 participants) • Otherwise, participants that gave data that resulted in a negative duration were coded as missing. (5 participants) • If never smokers also provided data on cigarettes and duration, pack-years were calculated for these participants. (15 participants) • If current smokers also provided data on years since quitting, the response for years since quitting was 	<p>Duration (for current smokers) = age at consent – age started smoking* <i>hn1_dv_age_cons</i> – <i>hn1_ay_a10_TobacUseAgeStart</i></p> <hr/> <p>Duration (for former smokers) = (age at consent – years since quitting) – age started smoking* <i>(hn1_dv_age_cons</i> – <i>hn1_ay_a9_TobacHowLngStopYrs)</i> – <i>hn1_ay_a10_TobacUseAgeStart</i></p>

			<p>ignored and duration was calculated as for current smokers. (5 participants)</p> <p>If participants with missing data for <i>hn1_a8_ay_tobacco</i> also provided data on cigarettes and duration, pack-years were calculated for these participants. (24 participants)</p>

		I feel tense or 'wound up':			I feel as if I am slowed down:
	3	Most of the time	3		Nearly all the time
	2	A lot of the time	2		Very often
	1	From time to time, occasionally	1		Sometimes
	0	Not at all	0		Not at all
		I still enjoy the things I used to enjoy:			I get a sort of frightened feeling like 'butterflies' in the stomach:
0		Definitely as much		0	Not at all
1		Not quite so much		1	Occasionally
2		Only a little		2	Quite Often
3		Hardly at all		3	Very Often
		I get a sort of frightened feeling as if something awful is about to happen:			I have lost interest in my appearance:
	3	Very definitely and quite badly	3		Definitely
	2	Yes, but not too badly	2		I don't take as much care as I should
	1	A little, but it doesn't worry me	1		I may not take quite as much care
	0	Not at all	0		I take just as much care as ever
		I can laugh and see the funny side of things:			I feel restless as I have to be on the move:
0		As much as I always could		3	Very much indeed
1		Not quite so much now		2	Quite a lot
2		Definitely not so much now		1	Not very much
3		Not at all		0	Not at all
		Worrying thoughts go through my mind:			I look forward with enjoyment to things:
	3	A great deal of the time	0		As much as I ever did
	2	A lot of the time	1		Rather less than I used to
	1	From time to time, but not too often	2		Definitely less than I used to
	0	Only occasionally	3		Hardly at all
		I feel cheerful:			I get sudden feelings of panic:
3		Not at all		3	Very often indeed
2		Not often		2	Quite often
1		Sometimes		1	Not very often
0		Most of the time		0	Not at all
		I can sit at ease and feel relaxed:			I can enjoy a good book or radio or TV program:
	0	Definitely	0		Often
	1	Usually	1		Sometimes
	2	Not Often	2		Not often
	3	Not at all	3		Very seldom

5.4.2 Tumour Data

Description	Variable Name	Definition
Clinical ICD code	hn1_dv_icd_code_clin	Clinical ICD code (from site completed DCF)
Clinical ICD code group	hn1_dv_icd_group_clin	Clinical ICD code (from site completed DCF) group. ICD codes were grouped as based on the AJCC Cancer Staging Manual v7.
Pathological ICD code	hn1_dv_icd_code_path	ICD Code as given on pathology report
Pathological ICD code group	hn1_dv_icd_group_path	Group of ICD code as given on pathology report
Combined ICD code	hn1_dv_icd_code_comb	This variable used ICD codes from pathology reports where available. Where the pathology ICD code was missing, the ICD code from the clinical notes (<i>hn1_na5a_cb_primary_icd</i>) was used.
Combined ICD code group	hn1_dv_icd_group_comb	This variable used ICD codes from pathology reports where available. Where the pathology ICD code was missing, the ICD code from the clinical notes (<i>hn1_na5a_cb_primary_icd</i>) was used.
Confirmed ICD code with salivary grouped	hn1_dv_icd_group_conf	To create the final variable presented here (<i>hn1_ICD_group_conf</i>), tumours identified as salivary gland based on pathology reports but not included in the salivary glands group were recoded as minor salivary gland tumours and then combined with major salivary gland tumours.
Clinical stage	hn1_dv_tnm_stage_clin	Clinical Tumour staging, based on the AJCC Cancer Staging Manual v7. This variable used ICD codes from pathology reports where available. Where the pathology ICD code was missing, the ICD code from the clinical notes (<i>hn1_na5a_cb_primary_icd</i>) was used.
Best TNM T	hn1_dv_tnm_t_best	TNM staging is categorised according to the TNM Classification of Malignant Tumours, Seventh Edition (Wittekind et al., 2009 [ref]). The following recodes were applied to the T, N, M variables in order to create this final TNM staging variable: dcf_b5b_RecentTNM_t Recoded to 1: 1/2, 1a, 1b, 1m. Recoded to 2: 2a, 2b. Recoded to 3: 3/4. dcf_b5c_RecentTNM_n* Recoded to 1: 1a, 1b, 1m. Recoded to 3: 3a, 3b. dcf_b5d_RecentTNM_m Recoded to 0: 0/1. Recoded to missing: x. *For thyroid cancer only, recoded to missing: 2b
Best TNM N	hn1_dv_tnm_n_best	
Best TNM M	hn1_dv_tnm_m_best	
Best stage	hn1_dv_tnm_stage_best	Clinical Tumour staging, based on the AJCC Cancer Staging Manual v7.
SNOMED Code grouping	hn1_dv_snomed_group	SNOMED codes grouped as follows: 1 - M8070/3 = Squamous carcinoma (Not otherwise specified) 2 - M8071/3 = Keratinising squamous carcinoma

		3 - M8072/3 = Non-keratinising squamous carcinoma
Treatment group - Planned	hn1_dv_tx_planned_group	Laser surgery (<i>hn1_nb2m_cb_laser_surg</i>) was considered equivalent to primary surgery (<i>hn1_nb2a_cb_surg_primary</i>).
Treatment group - Actual	hn2_dv_tx_actual_group	<p>Biological treatment (<i>hn1_nb2h_cb_biological</i>) was considered equivalent to chemotherapy (<i>hn1_nb2d_cb_chemother</i>).</p> <p>A new variable was created for radiotherapy. Participants received radiotherapy if they received teletherapy (<i>hn1_nb2c_cb_telether</i>) or brachytherapy (<i>hn1_nb2g_cb_brachyther</i>).</p> <p>Two variables were created to classify participants according to what kind of surgery they received and what kind of chemotherapy and/or radiotherapy they received. The categories were:</p> <p>Surgery</p> <p>1 - No surgery 2 - Primary surgery without neck surgery 3 - Primary surgery and neck surgery 4 - Other surgery (neck surgery or reconstructive surgery)</p> <p>Chemotherapy and/or radiotherapy</p> <p>1 - None 2 - Radiotherapy only 3 - Chemotherapy only 4 - Chemoradiotherapy, chemotherapy and radiotherapy</p> <p>These two variables were combined to create the treatment groups.</p>

5.4.3 Other Data

Description	Variable Name	Definition
Was participant alive at censoring date?	hn1_dv_vital_status	Vital status was taken from multiple sources, including site reported and NHS digital death data.
Days from consent to censoring or death	hn1_dv_days_frm_cnsnt_to_censdth	This variable shows the number of days between consent and the last date we had an update on any participants vital status or, if the participant is deceased (as denoted in the <i>hn1_dv_vital_status</i>) the number of days between consent and the date of death.
